\* In a 15-month randomized, multi-center, evaluator-blinded, split-hand, no treatment-controlled study, 100 Chinese patients received treatment with Restylane Skinboosters Vital to treat one dorsal hand. During the study period, three treatments were administered in the same hand starting with initial treatment and then spaced 1 month apart. Improved clinical appearance in treated hands, and improved skin surface roughness and hydration (measured objectively) were reported.<sup>9</sup>  
\*\* As assessed by the GAIS, patients who self-reported as "somewhat", "much" or "very much" improved. Patients received bilateral facial treatment with Restylane Skinboosters Vital: one side via needle, the other via cannula, injected over three treatment sessions spaced one month apart. N=36.<sup>13</sup>  
† 86.4%. As evaluated by self-assessment questionnaires. Level of agreement with statements was assessed using a 5-point scale. Patients had completed three injection treatments of Restylane Skinboosters Vital in the dorsal hand skin by Month 12, N=22.<sup>3</sup>  
‡ 95.5%. At the end of the study and upon completion of all procedures (Week 12), patients were asked to indicate whether they intended to continue their treatment, N=22.<sup>14</sup>  
§ In more than 8 million treatments globally.<sup>17</sup>  
|| Restylane Skinboosters Vital obtained CE certification in Europe in 2004.<sup>17</sup>
